

ReCircuit Intelligence Brief

Building the Intelligence Layer for the Circular Economy

Version 0.1 - founder research note

1. Problem

E-waste recovery is fragmented. Useful materials are lost, carbon data is weak, and reverse logistics decisions often happen without enough intelligence.

2. AI recovery intelligence

ReCircuit explores how computer vision, component analysis, valuation, and routing logic can support better recovery decisions without hiding uncertainty.

3. ESG evidence

The system design separates measured evidence from estimates. Strong claims require proof, chain-of-custody fields, processor records, and clear confidence levels.

4. Current stage

Research is active. Website is live. Architecture is complete. Prototype is in development. Pilot partners are coming soon after controlled testing workflows are ready.

5. Founder

Mohnish M is a Computer Science Engineering student building AI systems for the Circular Economy.
